

Fig. S1. Clinical and histopathological findings of 5 patients with lupus-like skin lesions at first presentation in our department. The clinical characteristics (type of lupus and location of skin lesions) and histopathology (inflammatory infiltrates, mucin deposition, and presence of atypical blasts) are detailed in Table I. HE: haematoxylin and eosin, original magnification $\times 40$. Alcian blue PAS (periodic acid-Schiff), original magnification $\times 100$. Giemsa, original magnification $\times 400$.
