

**Table SV. Probability of complete response achieved with implemented treatment modalities. Inclusion criteria for each treatment was implementation on primary tumour and/or metastasis**

Treatment modality	CR achieved	CR not achieved	Missing	Unadjusted OR (95% CI)	<i>p</i> -value
Surgical treatment alone	11/31	24/50	4	1 (ref)	
Surgical + radiation therapy <sup>a</sup>	18/31	16/50	4	2.46 (0.92–6.55)	0.07
Surgical + radiation <sup>a</sup> + systemic	2/31	7/50	4	0.62 (0.11–3.50)	0.59
Surgical + systemic	0/31	1/50	4	NA	NA
No treatment	0/31	2/50	4	NA	NA

Odds ratio (OR) above 1.00 indicates better prognosis.

<sup>a</sup>Palliative radiation therapy is not included in this analysis under radiation therapy, and thus cases with surgical treatment and palliative radiation therapy are under surgical treatment alone.

CI: confidence interval; CR: complete response; NA: not applicable.
