

Fig. S1. The rate of PASI improvement and pruritus VAS improvement after apremilast treatment.

The rate of improvement in PASI and pruritus VAS after apremilast treatment was demonstrated. The PASI score and pruritus VAS improved as early as 4 weeks after treatment, and the respective improvement rates increased steadily as weeks 16 and 20 progressed. Spots represent the mean value, and error bars represent 95%CI. Asterisks indicate statistical significance after Bonferroni correction ($p < 0.05$).
