

Supplementary material part 2

Supplementary Table S3

All occurring values of variables in the predictor data and association to melanoma outcome.

In this descriptive table, all computations have been made on all available data

including training, validation and test sets combined.

For example 2.3E-12 means 2.3×10^{-12}

CI: Confidence interval

log: the natural logarithm

Inf: infinity, since the computation sometimes cannot make an estimate due

to too few cases.

log(OR) (age, sex) represents an estimate controlling for age group and sex in a logistic regression

not accounting for a possible cross-effect between age and sex.

Empty cells represent instances where an estimate could not be made due to a low number of cases.

Adjusted P -values are adjusted using the Benjamini-Yekutieli method using all P -values where an

odds-ratio estimate could be made.
