A bibliography of Epidermolysis Bullosa

G.C. Priestley

Edinburgh 1987
From the Department of Dermatology, University of Edinburgh,
The Royal Infirmary, Edinburgh EH3 9YW, Scotland

Introduction

Getting to know about epidermolysis bullosa presents special problems to those who study its pathogenesis, or who care for a patient, perhaps for the first time. It is a heterogeneous family of blistering diseases (indeed it takes an extended family to accommodate the *acquisita* form), with a complex and still evolving genealogy. Descriptions of its appearance, forms of treatment, and attempts to explain its pathogeneses, are scattered through a wide variety of dermatological, surgical, paediatric, pathological, general medical, scientific and nursing journals, covering over a century of publication. Our bibliography brings together this diverse literature of more than 1300 titles up to the end of 1986.

Articles have been taken from *Index Medicus* and arranged chronologically. Although cross-checks against reviews suggest that the list is complete, I apologise for the inevitable omissions and mistakes. The older literature is a minefield of confusion, made worse by changing fashions of abbreviation, and where we were unable to check references at source we have been obliged to repeat doubtful or incomplete citations.

I am greatly indebted to David Pearce for his patient work in the library, to Jenny Stewart for her meticulous secretarial effort, and to the Dystrophic Epidermolysis Bullosa Research Association for their encouragement and support. The Association can be contacted through the Director, Mrs. Mary Freeland MBE, at 7 Sandhurst Lodge, Wokingham Road, Crowthorne, Berkshire RG11 7QD.
