

Fig. S1. Estimated survival curves of patients with diffuse large B-cell lymphoma (DLBCL), leg type and secondary cutaneous DLBCL. DLBCL, leg type demonstrated a better prognosis than secondary cutaneous DLBCL in terms of (a) overall survival and (b) progression-free survival. Patients with multiple skin lesions in secondary cutaneous DLBCL demonstrated a poorer (c) overall survival and (d) progression-free survival. Time-point of cutaneous involvement demonstrated significant effects on (e) overall survival and (f) progression-free survival outcomes of secondary cutaneous DLBCL.
