[a]Ordinal logistic regression, adjusted for age at diagnosis, birth-cohort, education, place of residence, and subtype. [b]Numbers may not add up to the total due to missing. [c]Estimation of linear trend conducted by treating the variable "Small symmetrical naevi on arms/legs" (with categories 0, 1–10, 11–50, ≥51) as continuous in the model. [d]Estimation was not calculated, due to small sample size.
